

Kyvern — Solana Frontier 2026 deck

Source markdown for the Frontier pitch deck. Render to PDF for the submission portal (each ## Slide = one slide).

Slide 1 — Title

Kyvern

Financial safety infrastructure for autonomous agents.

AI agents shouldn't have private keys. They should have budgets.

— Shariq Azeem · @shariqshkt · 🇵🇰 Pakistan kyvernlabs.com · `npm install @kyvernlabs/sdk`

Solana · Squads · pay.sh · KAST · npm

Slide 2 — The problem

Agents are getting wallets. Wallets get drained.

A 2026 AI agent buying API access, settling x402 calls, paying merchants needs a real spending mechanism on-chain. Three options today:

Option	Problem
Give the agent a hot wallet	One bad prompt drains everything
Manual approval per spend	Defeats the point of autonomy
Custodial credit (Stripe Issuing, etc.)	Slow, KYC-heavy, no on-chain settlement

Every Solana agent project ships into this gap. The bigger the agent ecosystem grows, the bigger the loss surface.

Slide 3 — The wedge: pay.sh's open question

Pay.sh — the Solana Foundation's payment layer for HTTP agents — just launched. It handles 402/x402/MPP challenges and asks the local wallet to sign. Their docs say:

"Real payments still require local user authorization."

That single line is the only thing standing between pay.sh and a fully autonomous agent. **Kyvern is what closes that gap.**

```
const allowance = await vault.checkAllowance({ merchant: "pay.sh", amount: 0.001 });
if (allowance.decision !== "allowed") return; // Kyvern refused — pay.sh never
invoked
const result = execSync(`pay --sandbox curl <pay.sh-service>`); // executes
```

Both products' value compounds. Pay.sh is the rails; Kyvern is the policy layer above the rails.

Slide 4 — Live demo: integrate + watch the chain

Sign in at **kyvernlab**s.com. Unbox cinematic plays (~2.5s). Land on the device — `/app` — with a 5-step integration wizard on the left and a live event feed on the right.

Step	Action	What lands
1	Mint your kv_live_... key	Copy it once — wizard unlocks
2	<code>npx create-kyvern-agent + npm install @kyvernlab</code> s/sdk	Copy commands
3	Paste-and-run the 3-line snippet — <code>vault.checkAllowance(...)</code>	Copy snippet
4	Click Try over-cap / off-allowlist / missing memo	Real failed Solana tx in your event feed in <3s, Kyvern errors 12002/12003/12004, clickable Explorer
5	Paste your KAST USDC deposit address	Real on-chain payout from your agent → KAST card

The agent's first event lands in the user's own feed within seconds. Every refusal includes the Kyvern policy program in the instruction trace.

The four affordance tabs above the chassis (Watch the chain · Wrap pay.sh · Send to KAST · Wrap your agent) open instrument-drawer panels with deeper interactions, including the real `pay --sandbox curl` shell-out that proves Kyvern wraps live x402-paywalled APIs.

[screenshot of the wizard at step 4 with the event feed showing a fresh blocked tx + Kyvern error 12002]

Slide 5 — Architecture: the layered Solana agent payments stack

- **Anchor program** at `PpmZErWfT5zpeo1fJtTbpqezFGbRUamaNNRWVlaMSqc` with 5 enforcement rules + a kill switch
- **@kyvernlabs/sdk@0.5.0** on npm — `Vault` , `OnChainVault` , `KastDestination` , `vault.checkAllowance()`
- **npx create-kyvern-agent my-agent** — scaffolder shipped
- **Atlas reference agent** running on Solana devnet since 2026-04-20 (19+ continuous days, 8.8k cycles, 1.3k settled, 6.5k+ blocked)

Slide 6 — Market

Distribution: SDK + scaffolder + on-chain program. Three install commands away from any agent's hot path.

TAM (2027):

- Solana agent ecosystem: ~\$X TAM by 2027
- Pay.sh catalog: 72 services and growing — every one a Kyvern wrap target
- Stablecoin agents are the next \$10B vertical; every wallet is a loss vector

Wedge:

- Every Solana agent project shipping this year is a Kyvern integration target
- Every pay.sh service URL works through Kyvern unchanged (composable)
- KAST off-ramp closes the loop into real-world spending (consumer pull)

Track: Infrastructure & Developer Tooling (cross-list AI x Solana)

Slide 7 — Why we win

	Competitors	Kyvern
Enforcement	Server-side rules	On-chain Anchor program
Evidence	Internal logs	Failed-tx Explorer links a judge can verify
Reference agent	Demo mode that resets	19 days unbroken on devnet
Distribution	Custom integration	<code>npm install @kyvernlabs/sdk</code>
Loop	Ends in a dashboard	Earnings flow to a real-world card via KAST
Composability	Closed	Wraps pay.sh, x402, any HTTP-402 rail

Two sentences in the hands of any builder:

1. `npm install @kyvernlabs/sdk`
2. `await vault.checkAllowance({ merchant, amount })`

Slide 8 — Team

Shariq Azeem — solo Pakistani builder

- 5 prior hackathon wins (\$4,250+)
- 3 prior x402 projects: ParallaxPay, TrendSurfer, x402-Oracle
- This sprint: collapsed Kyvern from "agent OS" to "financial safety infrastructure" in 48 hours. Real on-chain enforcement landed today (Block B), shell-out pay.sh integration verified live, SDK + scaffolder shipped to npm.

[@shariqshkt](#) · [GitHub](#)

Slide 9 — Roadmap

Now (devnet, today):

- Anchor program deployed with 5 rules + kill switch
- SDK 0.5.0 on npm, scaffolder 0.2.0 on npm
- Atlas reference agent live, 19 days unbroken
- /app with live integration wizard + per-user event feed (real failed Solana txs land in <3s)

Next 30 days (mainnet path):

- External audit kickoff (target: completion within 60 days)
- `update_allowlist` instruction wired to a self-serve UI for user vaults
- LangChain / Claude Agent SDK adapter v2

Q3 2026:

- Mainnet deploy
- Pay.sh + Kyvern co-published reference patterns
- KAST-rail compatibility extended (Pakistani PKR payouts in scope)

We do not claim a KAST partnership or a pay.sh partnership. The integration speaks via the working flow + the affiliate link.

Slide 10 — The ask

Track: Infrastructure & Developer Tooling (cross-list: AI x Solana) **Region:** Pakistan **Repo:**

github.com/shariqazeem/kyvern-atlas **Live:** kyvernlabs.com/app (sign in to see the integration console)

SDK: `npm install @kyvernlabs/sdk`

Funding tier: pursuing the Solana Frontier infrastructure award + the pay.sh ecosystem composability bonus.

AI agents shouldn't have private keys. They should have budgets. The chain has the receipts.

— Shariq Azeem ·
