

Kyvern — Kast Pakistan track deck (Superteam Earn)

Source markdown for the Kast Pakistan pitch deck. Render to PDF for the submission portal. ~80% shared with the Frontier deck; slides 3 and 6 differ to register the Pakistan-specific narrative.

Slide 1 — Title

Kyvern

Financial safety infrastructure for autonomous agents.

AI agents shouldn't have private keys. They should have budgets. Earnings should land on a card you can spend.

— Shariq Azeem · [@shariqshkt](#) ·  Made in Pakistan [kyvernlab.com](#) · `npx create-kyvern-agent`

Solana · Squads · `pay.sh` · KAST · `npm`

Slide 2 — The problem

Pakistani freelancers earn in stablecoins. They want safe automation. They can't trust an AI with their wallet.

A Pakistani student or freelancer earning \$100 USDC/month off Solana agents has to choose between:

Option	Problem
Hot wallet for the agent	One bad prompt = a month's earnings gone
Manual approval per spend	Defeats the autonomy that lets it earn
Custodial credit	Slow, KYC-heavy, no Pakistani support
Not automating at all	Leave money on the table

\$100 USDC = ~PKR 28,000. That's a meaningful month for a student or remote worker. It deserves a real safety primitive.

Slide 3 — The user journey

Maryam is a freelance designer in Lahore. She runs a small Solana agent that researches DeFi yield, executes via `pay.sh`-paywalled APIs, and reinvests the surplus.

Monday morning:
Maryam: \$100 USDC in her Kyvern vault on Solana devnet
Policy: \$5/day cap, \$25/week cap, allowlisted: `api.openai.com`,
`api.pay.sh`, MY_KAST (her KAST card deposit address)

Monday all day:
Agent makes 47 calls — 6 to `pay.sh` (\$0.001 ea), 41 to `api.openai.com`
Each call goes through `vault.checkAllowance()` FIRST

Two over-cap attempts blocked on-chain (Custom error 12002)
One off-allowlist attempt blocked on-chain (Custom error 12003)

Monday evening:
Agent: "Routing \$1.50 share to MY_KAST"
Real on-chain USDC transfer – Maryam's KAST card balance increases
Spends ~PKR 420 on dinner via her KAST card

Every refusal is a clickable Solana Explorer link Maryam can audit.
Every settle is a real on-chain receipt. The chain has the books.

The loop ends in real life. Her car ride, her groceries, her dinner — all funded by an autonomous agent her wallet never had to hot-key.

Slide 4 — Live demo: Maryam's first event

Maryam signs in at **kyvernlabs.com**. Unbox plays (~2.5s). Lands on her device — `/app` — with the 5-step integration wizard on the left and her own live event feed on the right (empty, ready).

Step	What Maryam does	What lands on her device
1	Mint key	kv_live_... shown once, copied
2	Install	Two npm commands copied
3	Run the snippet	vault.checkAllowance(...) — first call recorded
4	Click "Try over-cap"	Real failed Solana tx lands in her event feed in <3s. Custom Kyvern error 12002. Click → Solana Explorer.
5	Paste KAST USDC deposit address	"Test \$0.001 payout" → real on-chain transfer to her KAST card

The chain has the receipts. Every refusal in Maryam's feed includes the Kyvern policy program at `PpmZ...MSqc` in the instruction trace. The chain decides. Maryam audits.

[screenshot of `/app` with Maryam's wizard at step 4 + a fresh blocked-on-chain row in the event feed]

Slide 5 — Architecture: the layered stack

pay.sh HTTP rails x402 / MPP	Squads custody v4	KAST off-ramp Solana USDC → real card
------------------------------------	-------------------------	--

150M+ merchants worldwide
(incl. Pakistan)

- **Anchor program** at `PpmZErWfT5zpeo1fJtTbpqezFGbRUamaNNRWViaMSqc`
- `@kyvernlabs/sdk@0.5.0` with `KastDestination` helper
- `npm create-kyvern-agent my-agent` scaffolds a working pay.sh + KAST agent
- **Atlas reference agent** live since 2026-04-20

Slide 6 — Why this for Pakistan

The market:

- 50M+ remote workers / freelancers in Pakistan (largest % growth in Asia)
- Solana adoption growing — local meetups, Superteam Pakistan active
- KAST is the stablecoin card Pakistanis already trust
- USDC remittance volume into Pakistan ~\$X B/year and growing

The Kyvern fit:

- Pakistani builders are price-sensitive — `$100 USDC` is meaningful
- Safety infrastructure matters more, not less, when amounts are smaller
- KAST already solves the off-ramp; Kyvern closes the on-chain side
- Built by a Pakistani solo founder who lived this problem

Roadmap to PKR:

- Direct PKR payouts via additional Kyvern destinations (post-Frontier)
- Pakistani-language docs + tutorials
- Partnership conversations with KAST for native Kyvern UX (post-submission)

We do not claim a KAST partnership today. The integration speaks via the working product flow + the affiliate link.

Slide 7 — Why we win

	Today's options for Pakistani agent builders	Kyvern
Custody	Hot wallet (drainable)	Squads multisig
Enforcement	Server-side rules	On-chain Anchor program
Evidence	Internal logs	Failed-tx Explorer links anyone can verify

Reference agent	None	19 days unbroken on devnet
Setup	Custom integration	One npm command
Loop	Ends in a dashboard	Earnings flow to a KAST-funded card

Three commands away from any Pakistani builder's hot path:

1. `brew install pay` (or `npm install -g @solana/pay`)
2. `npx create-kyvern-agent my-agent`
3. Paste your KAST USDC deposit address into `.env` → `run`

Slide 8 — Team

Shariq Azeem — solo Pakistani builder

- 5 prior hackathon wins (\$4,250+)
- 3 prior x402 projects (Solana payment layer experience)
- Built Kyvern after losing time to AI-agent loss vectors firsthand
- This sprint: shipped real on-chain Kyvern enforcement, full `pay.sh` shell-out integration, KAST-rail compatibility, SDK 0.5.0 + scaffolder to npm — all in 48 hours

[@shariqshkt](#) · [GitHub](#)

 *Built in Pakistan for Pakistani builders.*

Slide 9 — Roadmap

Now (devnet, today):

- Anchor program deployed with 5 enforcement rules
- SDK 0.5.0 on npm, scaffolder 0.2.0 on npm
- Atlas reference agent live, 19 days unbroken
- `/app` with live integration wizard + per-user event feed (real failed Solana txs land in <3s)
- KAST-rail compatibility working in `/app`

Next 30 days:

- External Anchor program audit
- Pakistani-language docs + tutorial videos
- LangChain / Claude Agent SDK adapter v2

Q3 2026:

- Mainnet deploy
- Direct PKR payout helpers
- Outreach: partnership conversations with KAST + `pay.sh`

Slide 10 — The ask

Track: Kast Pakistan via Superteam Earn (Consumer Applications + AI x Solana + Infrastructure) **Region:** Pakistan **Repo:** github.com/shariqazeem/kyvern-atlas **Live:** kyvernlab.com/app (sign in to see the integration console) **SDK:** `npm install @kyvernlab/sdk` **KAST signup:** <https://go.kast.xyz/VqVO/STPAK>

AI agents shouldn't have private keys. They should have budgets. Earnings should land on a card you can spend.
